Pb+2_OH-1(2)_(s) = Pb+2 + 2<OH-1>

Note: The experimental evidence regarding this solid, Pb+2_OH-1(2)_(s), is not entirely clear but there is no doubt that it hardly ever forms. The main reason for this is that Pb solids with counter-ions other than hydroxide tend to appear instead. While there may be some very unusual circumstances in which Pb+2_OH-1(2)_(s) does form, it is given Wgt = 0 here to guard against it appearing in 'normal' model results - a far more likley error. See Todd & Parry, Nature, 1964, 202,386 (which accords with GTH's view). Reports to the contrary (e.g. Randall & Spencer, JACS, 28, 50, 1572; Pokric & Pucar, J. Inorg. Nucl. Chem., 1973, 35, 1987 & Anal. Chem., 1975, 47, 1970) are either erroneous or refer not to Pb+2_OH-1(2)_(s) but to more stable Pb oxides, such as PbO.0.4H2O(s).
