Note: Rxn is problematic. This is a (rather pathetic) compromise between Ca+2 + Citric-3 + H+1_PO4-3 = Ca+2_H+1_Citric-3_PO4-3 (Rxn 59,332) as measured by R&M and my opinion that their value is too high.

Note: This reaction is particularly difficult. B120 for citrate is uncertain but probably around lgK=5.8 B120 for phosphate is unavailable (either as L-3 or L-2); prob. insol. so it cannot be estimated in the usual way B110 for citrate has lgK = 4.8 B110 for hydrogen phosphate has lgK = 2.6 The above data suggest that this rxn will be rather weak; lgK < 8 (unless there is a remarkable synergistic effect). The choice is thus between a measurement by often-unreliable researchers (Ramamoorthy and Manning) and the above tenuous estimate. Sticking with R&M for the time being (15/9/19).
